

Product roadmap

The vision

A **self-imposed trading discipline platform for crypto.**

The user decides, while calm:

"This is how much I'm allowed to trade."

The platform then creates friction when emotional/future-you tries to violate those decisions.

Eventually:

Your wallet itself enforces your trading constitution.

The progression is:

Rules → Trading → Accountability → Gamification → Intelligence → Enforced Vault

Phase 0 — Validate the commitment mechanism

Goal

Prove that traders actually **want to voluntarily restrict themselves.**

Don't build a full exchange yet.

Don't build smart contracts.

Don't even worry about profitability.

Build

A simple web app:

Connect wallet

↓

Create your trading constitution

For example:

DAILY

Max trading: \$500
Max trades: 5
Max loss: \$250

PER TRADE

Maximum trade: \$200

ASSET LIMITS

BTC: \$500/day
ETH: \$500/day
SOL: \$200/day
Other alts: \$100/day
Memecoins: \$25/day

COOLDOWNS

After loss: 30 minutes

RULE CHANGE

Increasing limits: 48 hours
Decreasing limits: Immediate

↓

20-minute commitment period

↓

 **Rules activated**

Then monitor their wallet.

The killer feature

If they violate their rules somewhere else:

 **We saw that.**

No punishment.

Just accountability.

What you're measuring

Not money.

You're measuring:

- Do people complete onboarding?
- Do they actually set limits?
- Do they activate them?
- Do they return?
- Do they keep their rules?
- How often do they violate them externally?
- Do they ask for stricter rules?
- Do they voluntarily use the product again?

Your most important signal

Someone says:

"I know I can bypass this, but I don't want to. I need this."

That's product-market signal.

Phase 1 — Jupiter trading terminal

Now make the product actually useful.

Architecture

Wallet

Your Trading UI

Rule Engine

Jupiter

Solana

The user still owns everything.

You don't custody funds.

They sign transactions.

Rules are enforced for trades through your platform

User tries:

Buy \$250 SOL

Engine:

SOL daily allowance: \$200

Requested: \$250

 BLOCKED

Your app says:

 Nice try.

Your SOL allowance is already exhausted.

Then they can go to Jupiter directly if they really want.

That's okay.

Critical security principle

If you're using connected wallets, **you don't need private keys**.

You're providing:

interface + policy engine + execution

rather than custody.

Phase 2 — Make the rules powerful

Now move beyond simple daily limits.

Per-trade limits

Maximum \$200

Daily limits

Maximum \$500/24h

Number of trades

Maximum 5/day

Asset limits

BTC \$500

ETH \$500

SOL \$200

ALT \$100
MEME \$25

Portfolio limits

Maximum 10% of portfolio in memecoins.

Loss limits

Stop trading after \$250 loss.

Cooldowns

Losing trade → 30-minute cooldown.

Three consecutive losses → 2-hour cooldown.

Time restrictions

Potentially:

No trading between 2am–7am.

That could be particularly interesting for the "future self" concept.

Phase 3 — The commitment engine

This becomes one of your core pieces of IP/product differentiation.

Every rule has a state:

ACTIVE

↓

CHANGE REQUESTED

↓

48 HOUR WAIT

↓

ACTIVE WITH NEW LIMIT

For example:

Current SOL limit: **\$200**

User requests:

New SOL limit: **\$1,000**

Your app:

 **Change scheduled**

Current limit remains \$200.

New limit activates in:

47:32:18

And:

Decreasing limits

Immediate.

Increasing limits

Delayed.

Removing a rule

Potentially even longer.

For example:

Increase: 48h

Remove: 7 days

That's important because otherwise the user can simply weaken the commitment mechanism itself.

Phase 4 — Wallet accountability

Now the platform becomes much more interesting.

You monitor the connected Solana wallet through RPC/indexing infrastructure.

You can distinguish:

Trading through your platform

vs.

Trading elsewhere

Suppose:

Your app says:

SOL limit: \$200

They open another application and buy \$500 SOL.

Your system detects it.

Next time they open the app:

 **External trade detected**

SOL limit: \$200

External trading: \$500

Rule violation #3

You don't pretend you can stop them.

You simply say:

We know.

Phase 5 — Behavioral dashboard

Now the app starts becoming more than a trading interface.

Your Discipline

96.4%

This month

Rules followed	96.4%
External violations	3
Blocked trades	17
Cooldowns triggered	8
Trading days	21
Current streak	14 days

And:

 **17 trades stopped**

This is where I'd introduce your core concept:

"Times you stopped yourself"

That's much more emotionally meaningful than P&L.
